Multiple-Choice Example

Which organelle is primarily responsible for energy production in a cell?

- A) Nucleus
- B) Mitochondria
- C) Ribosome
- D) Chloroplast

Answer: B) Mitochondria

Short-Answer Example

Describe how the structure of a leaf's stomata helps prevent water loss while allowing gas exchange.

Sample Response:

Stomata are small openings on the leaf surface that can open and close. When open, they allow gases like carbon dioxide to enter for photosynthesis and oxygen to exit. Closing the stomata helps prevent excessive water loss through evaporation, especially during hot or dry conditions. This regulation helps the plant maintain water balance while allowing necessary gas exchange.

Performance Task Example

Given a data table showing the growth of bacteria in different conditions, design an experiment to test the effect of pH on bacteria growth. Include your hypothesis, procedure, and how you would analyze the data.

Sample Approach:

- Hypothesis: Bacteria grow best at a neutral pH of 7.
- Procedure: Prepare nutrient broth solutions at various pH levels (e.g., 4, 7, 9). Inoculate each with bacteria and incubate under the same conditions. Measure growth by turbidity after 24 hours.
- Data Analysis: Plot bacterial growth against pH levels and determine at which pH the growth is maximized.
