- Isolating the Faulty IC

- Use a process of elimination, ruling out peripheral issues.
- Check neighboring components for damage or abnormal readings.
- Employ specialized tools like IC testers or test clips.

- Removing the Faulty Chip

- Preparation: Clean the area, apply flux to facilitate rework.

- Heating: Use BGA or hot air rework stations to uniformly heat the IC.
 - Desoldering: Carefully lift the IC without damaging the PCB pads.
 - Inspection: Verify complete removal and check for pad integrity.
-
- Cleaning and Preparing for Replacement
-
- Remove residual solder using desoldering braid or vacuum pumps.
 - Clean the pads thoroughly to ensure a good connection.
 - Inspect the pads and traces for damage.
-
- Installing the Replacement Chip
-
- Placement: Position the new IC precisely using tweezers and magnification.
 - Soldering: Use controlled heat and solder paste for BGA or surface-mount components.
 - Reflow Process: Employ BGA rework stations for uniform soldering.
 - Inspection: Use X-ray or microscope to confirm proper solder joints.
-
- Testing and Validation
-
- Power on the motherboard and check if the fault is resolved.
 - Measure voltages, signals, and operational parameters.
 - Run diagnostic tests or boot the system to verify stability.
