Sample Excel Test Questions and Expert-Approved Answers

Below, we explore common questions across various difficulty levels, providing detailed explanations to clarify concepts and techniques.

Basic Level Questions

Q1: How do you create a basic formula to add the values in cells A1 and B1?

Answer:

Type the formula `=A1+B1` into the cell where you'd like the sum to appear, then press Enter. This simple addition formula instructs Excel to sum the contents of cells A1 and B1 dynamically. Remember, all formulas in Excel start with an equal sign (=).

Key Point:

- Formulas can incorporate cell references, constants, and functions.
- Use relative references (like A1) for formulas that should adjust when copied.

Q2: How can you quickly fill a series of numbers (e.g., 1, 2, 3, ...) in a column?

Answer:

Enter the starting number (e.g., 1) in the first cell. Then, click and drag the fill handle (small square at the bottom-right corner of the cell) down the column. Excel recognizes the pattern and automatically continues the series. Alternatively, you can use the Fill Series option:

- Go to the Home tab.
- Click Fill > Series.
- Choose Columns, set the Step Value (e.g., 1), and click OK.

Intermediate Level Questions

Q3: How do you use the VLOOKUP function to find a value in a table?

Answer:

VLOOKUP (Vertical Lookup) searches for a value in the first column of a table and retrieves corresponding data from another column.

Syntax:

```
=VLOOKUP(lookup_value, table_array, col_index_num, [range_lookup])
```

Example:

Suppose you have a product list in cells A2:C100, where column A contains product IDs, and column C contains prices.

To find the price of product ID "P123", you would write:

```
=VLOOKUP("P123", A2:C100, 3, FALSE)
```

- `lookup_value`: the product ID you're searching for.
- `table_array`: the range containing your data.
- `col_index_num`: the column number from which to retrieve data (3 for price).
- `[range_lookup]`: FALSE for an exact match.

Key Tips:

- Ensure the lookup column (A in this case) is sorted if using TRUE for approximate matches.
- VLOOKUP searches from left to right; for more flexible lookups, consider INDEX/MATCH.

Q4: How can you filter data in Excel to display only rows that meet certain criteria?

Answer:

Use the Filter feature:

- Select your data range.
- Go to the Data tab.
- Click Filter.
- Dropdown arrows will appear in the header row.

- Click the arrow for the relevant column and select criteria (e.g., values greater than a certain number, specific text).

This process dynamically displays only the rows matching your filter criteria, which is essential for data analysis and reporting.

Advanced Level Questions

Q5: How do you create a pivot table to summarize sales data?

Answer:

Pivot tables are powerful tools to analyze large datasets efficiently.

Steps:

- Select your data range.
- Go to the Insert tab and click PivotTable.
- In the dialog box, choose whether to place the pivot table in a new worksheet or existing sheet.
- Drag relevant fields into the Rows, Columns, Values, and Filters areas.

Example:

- Drag "Product Category" to Rows.
- Drag "Sales Amount" to Values (default sum).
- Optionally, drag "Region" to Columns or Filters.

This setup provides a dynamic summary of sales per category and region, which can be updated instantly by changing filters or field arrangements.

Q6: How do you write a nested IF formula to categorize data?

Answer:

Nested IF statements allow complex decision-making in Excel.

Example:

Suppose you want to categorize sales performance:

- Sales > 1000: "Excellent"
- Sales between 500 and 1000: "Good"
- Sales

The formula:

```
```excel
```

```
=IF(A2>1000,"Excellent",IF(A2>=500,"Good","Needs Improvement"))
```

```
```
```

This formula checks the first condition; if false, moves to the second, and defaults to the last category if all conditions fail.

Expert Tip: For complex nested conditions, consider using the IFS function (Excel 2016+), which improves readability.
