This guide synthesizes key concepts, diagnostic approaches, and therapeutic strategies, making it an essential reference in understanding gastrointestinal health and disease.

Anatomy and Physiology of the Gastrointestinal Tract

Understanding the anatomy and physiology of the GI system is foundational in diagnosing and managing GI disorders. The GI tract is a complex, coordinated system responsible for digestion, absorption, and waste elimination.

Major Components of the GI Tract

- Oral Cavity: Includes the mouth, teeth, tongue, and salivary glands, initiating digestion through mastication and saliva secretion.
- Esophagus: A muscular tube transporting food from the throat to the stomach.
- Stomach: A muscular organ that mixes food with gastric juices, initiating protein digestion.
- Small Intestine: Comprising the duodenum, jejunum, and ileum, this is the primary site for nutrient absorption.
- Large Intestine: Responsible for water absorption, fecal formation, and hosting gut microbiota.
- Accessory Organs: Liver, gallbladder, and pancreas aid in digestion through bile and enzyme production.

Physiological Functions

- Motility: Coordinated muscular contractions propel and mix contents.
- Secretion: Glands secrete enzymes, acids, and mucus necessary for digestion.
- Digestion and Absorption: Breakdown of food into absorbable units.

- Immune Function: Gut-associated lymphoid tissue (GALT) provides immune defense.
- Microbiota: Resident bacteria influence health, immunity, and disease.

Common Gastrointestinal Disorders and Their Pathophysiology

A thorough understanding of disease mechanisms is critical for effective diagnosis and treatment.

Gastroesophageal Reflux Disease (GERD)

GERD occurs when the lower esophageal sphincter (LES) relaxes inappropriately, allowing gastric contents to reflux into the esophagus, causing symptoms like heartburn and esophagitis.

- Pathophysiology: Dysfunction of LES, impaired esophageal clearance, delayed gastric emptying.
- Contributing factors: Obesity, hiatal hernia, certain foods, smoking.

Peptic Ulcer Disease (PUD)

PUD involves mucosal erosion due to imbalance between gastric acid secretion and mucosal defenses, often associated with *Helicobacter pylori* infection or NSAID use.

- Types: Gastric ulcers and duodenal ulcers.
- Pathogenesis: *H. pylori* induces inflammation; NSAIDs inhibit prostaglandin synthesis.

Inflammatory Bowel Disease (IBD)

IBD includes Crohn's disease and ulcerative colitis, characterized by chronic inflammation of the GI tract with immune-mediated mechanisms.

- Crohn's Disease: Transmural inflammation affecting any GI segment, often with skip lesions.
- Ulcerative Colitis: Mucosal inflammation limited to the colon and rectum.

Irritable Bowel Syndrome (IBS)

IBS is a functional disorder characterized by altered bowel habits and abdominal pain without structural abnormalities.

- Subtypes: Constipation-predominant, diarrhea-predominant, mixed.
- Pathophysiology: Visceral hypersensitivity, motility disturbances, psychosocial factors.

Liver and Biliary Diseases

Includes conditions like hepatitis, cirrhosis, and biliary obstructions, impacting liver function and metabolism.
