Biomechanics, a key interdisciplinary field, applies principles of mechanics to biological systems. It explains how muscles generate forces, bones provide support, and joints facilitate movement.

Newtonian Mechanics in Musculoskeletal Motion

At the core of movement analysis lies Newton's laws of motion:

- First Law (Inertia): A body remains at rest or in uniform motion unless acted upon by an external force. For instance, a limb remains stationary unless muscles exert forces to move it.
- Second Law ($F=ma$): Force equals mass times acceleration. This principle explains how muscle contractions produce movements or how external forces impact the body.
- Third Law (Action-Reaction): For every action, there's an equal and opposite reaction. When your foot pushes against the ground, the ground pushes back, propelling you forward.

In practical terms, consider running: muscles generate forces that accelerate limbs, joints provide pivot points allowing motion, and ground reaction forces influence gait and stability.

Forces in Biological Structures

The body withstands various forces:

- Compression: Bones and cartilage handle compressive forces during weight-bearing activities.
- Tension: Tendons and ligaments resist tensile forces during movement.

$$Q = \frac{\pi r^4 \Delta P}{8 \eta l}$$

$$Q = \frac{\pi r^4 \Delta P}{8 \eta l}$$

$$Q = \frac{\pi r^4 \Delta P}{8 \eta l}$$

where Q is flow rate, r is vessel radius, ΔP is pressure difference, η is viscosity, and l is vessel length.

- Heart as a Pump: The heart generates pressure and flow, functioning as a piston-like pump that maintains circulatory dynamics.

Respiratory Fluid Mechanics

Breathing involves airflow through the respiratory tract:

- Airway Resistance: Governed by Poiseuille's law, changes in airway diameter (e.g., during asthma) significantly affect airflow.
- Lung Compliance: The ease with which lungs expand relates to elastic properties of lung tissue, influenced by the surface tension of alveolar fluid and tissue elasticity.

Practical Problems and Solutions in Physics for Biology and Medicine

Let's explore some common problems, their underlying physics principles, and step-by-step solutions, highlighting how physics concepts are practically applied.

Problem 1: Blood Flow and Poiseuille's Law

Scenario:

A physiologist wants to estimate the flow rate of blood through an artery with a radius of 3 mm and length of 10 cm. The blood's viscosity is approximately 3.5 cP (centipoise), and the blood pressure difference across the artery is 40 mm Hg.

Question:

What is the volumetric flow rate of blood through the artery?

Solution Approach:

This problem involves fluid dynamics, specifically Poiseuille's law, which describes laminar flow of a viscous fluid through a cylindrical tube.

Step-by-step solution:

- Identify known variables:

- Radius, $(r = 3 \text{ mm} = 3 \times 10^{-3} \text{ m})$
- Length, $(L = 10 \text{ cm} = 0.1 \text{ m})$
- Viscosity, $(\eta = 3.5 \text{ cP})$

Convert viscosity to SI units:

$$1 \text{ cP} = 1 \times 10^{-3} \text{ Pa} \cdot \text{s}$$

So,

$$\eta = 3.5 \times 10^{-3}, \text{Pa} \cdot \text{s}$$

]

- Pressure difference, $(\Delta P = 40, \text{mm Hg})$

Convert to Pascals:

[

$$1, \text{mm Hg} \approx 133.3, \text{Pa}$$

]

[

$$\Delta P = 40 \times 133.3 \approx 5332, \text{Pa}$$

]

- Poiseuille's law:

[

$$Q = \frac{\pi r^4 \Delta P}{8 \eta L}$$

]

- Calculate (Q) :

[

$$Q = \frac{\pi (3 \times 10^{-3})^4 \times 5332}{8 \times 3.5 \times 10^{-3} \times 0.1}$$

]

- Numerical computation:

$$- \text{ } r^4 = (3 \times 10^{-3})^4 = 81 \times 10^{-12}, \text{ } \text{m}^4 \text{)}$$

- Numerator:

$$\sqrt[4]{}$$

$$\pi \times 81 \times 10^{-12} \times 5332 \approx 3.1416 \times 81 \times 10^{-12} \times 5332$$

$$\sqrt[4]{}$$

Calculating:

$$\sqrt[4]{}$$

$$3.1416 \times 81 \approx 254.4696$$

$$\sqrt[4]{}$$

$$\sqrt[4]{}$$

$$254.4696 \times 5332 \approx 1.357 \times 10^6$$

$$\sqrt[4]{}$$

$$\sqrt[4]{}$$

$$\text{Numerator} \approx 1.357 \times 10^6 \times 10^{-12} = 1.357 \times 10^{-6}$$

$$\sqrt[4]{}$$

- Denominator:

$$\sqrt[4]{}$$

$$8 \times 3.5 \times 10^{-3} \times 0.1 = 8 \times 3.5 \times 10^{-4} = 8 \times 0.00035 = 0.0028$$

$$\sqrt[4]{}$$

- Final calculation:

\[

$$Q = \frac{1.357 \times 10^{-6}}{0.0028} \approx 0.000484 \, \frac{\text{m}^3}{\text{s}}$$

\]

Answer:

The blood flow rate is approximately 0.484 mL/sec (since $(1 \, \text{m}^3 = 10^6 \, \text{mL})$).

Problem 2: Nerve Signal Transmission and Cable Theory

Scenario:

A myelinated nerve fiber conducts signals at a velocity of approximately 100 m/s. The fiber has an internal diameter of 10 μm , and the membrane capacitance per unit length is about 1 $\mu\text{F}/\text{cm}$.

Question:

Estimate the time delay for a nerve signal traveling 1 meter along the fiber.

Solution Approach:

This involves understanding the physics of electrical conduction in nerve fibers, modeled similarly to cable theory, where the conduction velocity depends on the properties of the fiber.

Step-by-step solution:

- Calculate conduction time:

\[

$$t = \frac{\text{distance}}{\text{velocity}} = \frac{1 \, \text{m}}{100 \, \text{m/s}} = 0.01 \, \text{s} = 10 \, \text{ms}$$

\]

Answer:

It takes approximately 10 milliseconds for the nerve signal to travel 1 meter along the fiber.

Problem 3: Medical Imaging - MRI Signal Strength

Scenario:

An MRI machine uses a magnetic field of 3 Tesla. Hydrogen nuclei (protons) in the body align with this field. The net magnetic moment is proportional to the magnetic field strength and the number of protons.

Question:

How does increasing the magnetic field from 1.5 Tesla to 3 Tesla affect the net magnetization, assuming all other factors remain constant?

Solution Approach:

The net magnetization (M) in MRI is proportional to the magnetic field (B_0) :

$[$

$M \propto B_0$

$]$

Calculation:

$[$

$\frac{M_{3T}}{M_{1.5T}} = \frac{3\text{ T}}{1.5\text{ T}} = 2$

$]$

Answer:

Doubling the magnetic field strength from 1.5 T to 3 T doubles the net magnetization, leading to a stronger MRI signal and potentially higher image resolution.
